

# STAR Cushion 'Bottoming Out' Inflation Test

1. Place the STAR Cushion with cover onto the chair, orientated correctly as marked on the cushion
2. Locate the silver valve on the left front side of the cushion
3. Open the valve by turning anticlockwise

4. Attach the pump to the valve and pump to inflate the cushion to maximum

5. Remove the pump
6. Leave the valve open and let the cushion sit untouched for 5 minutes to allow the air to equalise
7. Close the valve by turning clockwise

8. Position the Client on the cushion positioned as desired

9. Perform a bottoming out/inflation test
  - Apply the MaxiGlide Glove to your hand
  - Insert your hand facing down between the Client and the cushion
  - Locate your fingers under the ischial tuberosity
  - Move your fingers up and down to determine height of the cushion
  - Desired height is 2-3cm of inflation under the ischial tuberosities

- If less than 2cm inflation open the valve and use the pump to add more air into the cushion
- If greater than 3cm open valve and release some air from the cushion
- Complete the bottoming out test again until desired height of 2-3cm under the Ischial Tuberosities is reached
- Remove hand and glove

10. Recheck cushion using bottoming out test at regular intervals to ensure appropriate inflation is maintained
