Sling					
Mobility					
Shower					
Bathroom Aids					
Toilet					

LOCOmotion

### Level A

Client can independently perform the action, with or without equipment, and without risk of physical overload for the healthcare workers. Stimulating self-reliance is of great importance.

### Level B

Client needs help, but this does not cause physical overload for the healthcare workers. Stimulating self-reliance is of great importance.

### Level C

Client needs help. This causes physical strain for the healthcare workers when equipment is not used. The client can however substantially contribute to the action. Stimulating activity and self-reliance is of great importance.

### Level D

Client needs help. This causes physical strain for the healthcare workers when equipment is not used. Client is very passive and can barely contribute. Stimulating activity and self-reliance remain of great importance.

### Level E

Client needs a lot of help. This causes physical strain for the healthcare workers when equipment is not used. Client is completely passive. Stimulating activity is not a priority: comfort and safety are the main concerns.
